

## Experiment 7

**Aim:** To write meta data of your Ecommerce PWA in a Web app manifest file to enable “add to homescreen feature”.

### **Theory:**

Progressive Web Apps (PWAs) are a type of web application built using web technologies such as HTML, CSS, and JavaScript, but they are designed to provide a user experience similar to native mobile apps. Here's the theory behind PWAs:

### **Progressive Enhancement:**

PWAs are built using the concept of progressive enhancement, which means they are designed to work on any device or browser regardless of the user's network conditions. They leverage modern web capabilities to provide a seamless experience while gracefully degrading on older browsers or devices.

### **Responsive Design:**

PWAs are designed to be responsive, meaning they can adapt and provide an optimal user experience across various devices, including desktops, smartphones, and tablets. This ensures that users can access the app regardless of the device they are using.

### **Service Workers:**

One of the key features of PWAs is the use of service workers, which are JavaScript files that run in the background separate from the web page. Service workers enable features such as offline functionality, push notifications, and caching, allowing PWAs to work even when the user is offline or has a slow or unreliable network connection.

### **Difference between Progressive Web Apps (PWAs) and Regular Web Apps:**

1. **Offline Functionality:** PWAs can work offline or with a limited network connection using service workers, while regular web apps typically require a constant internet connection to function.
2. **Installation:** PWAs can be installed on a user's device and accessed from the home screen, providing an app-like experience. Regular web apps are accessed through a web browser and do not have the option for installation.
3. **Native-Like Features:** PWAs can leverage native-like features such as push notifications, full-screen mode, and access to device hardware (e.g., camera, GPS) using web APIs, whereas regular web apps have limited access to such features.
4. **Performance:** PWAs are designed to be fast and responsive, providing a smooth user experience similar to native apps. Regular web apps may suffer from performance issues, especially on mobile devices with slower processors or limited memory.

5. Discoverability: PWAs can be discovered and indexed by search engines, allowing users to find them through web searches. Regular web apps may have limited discoverability, especially if they are not optimized for search engines.

**The below steps have to be followed to create a progressive web application:**

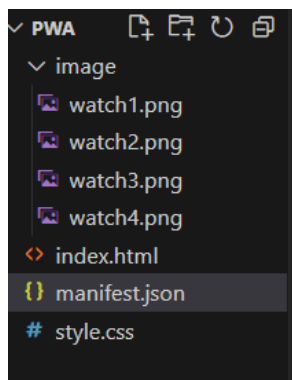

1. Step 1: Create an HTML page that would be the starting point of the application. This HTML will contain a link to the file named manifest.json. This is an important file that would be created in the next step.

```
index.html X # style.css
index.html > html > body > main > section.products > div.container > div.product > img
1  <!DOCTYPE html>
2  <html lang="en">
3  <head>
4      <meta charset="UTF-8">
5      <meta name="viewport" content="width=device-width, initial-scale=1.0">
6      <title>Futuristic Watch Store</title>
7      <link rel="stylesheet" href="style.css">
8  </head>
9  <body>
10     <header>
11         <div class="container">
12             <h1> Watch Store</h1>
13             <nav>
14                 <ul>
15                     <li><a href="#">Home</a></li>
16                     <li><a href="#">Shop</a></li>
17                     <li><a href="#">About</a></li>
18                     <li><a href="#">Contact</a></li>
19                 </ul>
20             </nav>
21         </div>
22     </header>
23
24     <main>
25         <section class="products">
26             <div class="container">
27                 <h2>Featured Products</h2>
28                 <div class="product">
29                     
30                     <h3>Rolex</h3>
31                     <p>$200</p>
32                     <button>Add to Cart</button>
```

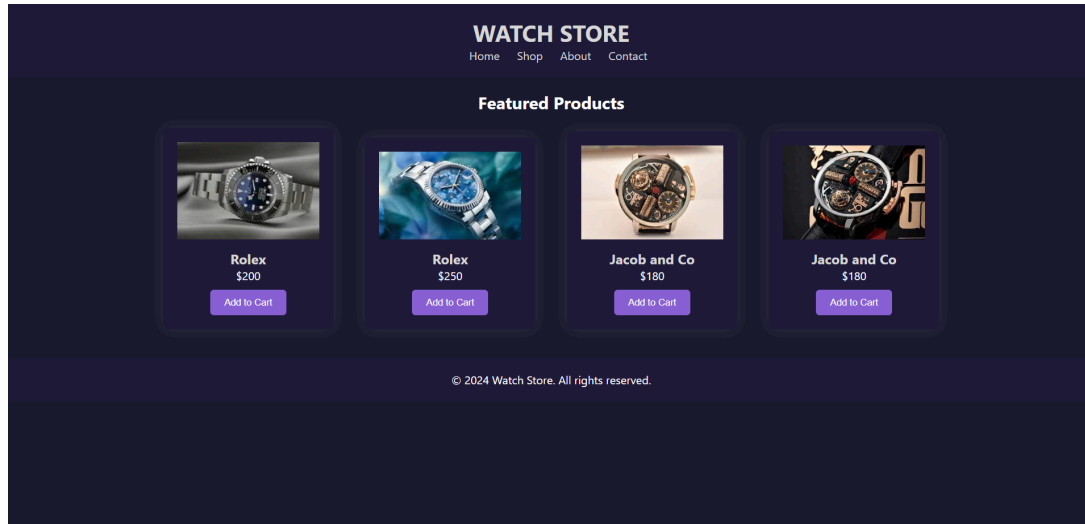

**Step 2:** Create a manifest.json file in the same directory. This file basically contains information about the web application. Some basic information includes the application name, starting URL, theme color, and icons. All the information required is specified in the JSON format. The source and size of the icons are also defined in this file.

```
<> index.html {} manifest.json X # style.css
manifest.json > [ ] icons
1  {
2    "name": "Futuristic Watch Store",
3    "short_name": "Watch Store",
4    "start_url": "/",
5    "display": "standalone",
6    "theme_color": "#007bff",
7    "background_color": "#ffffff",
8    "icons": [
9      {
10       "src": "image\\watch1.png",
11       "type": "image/png",
12       "sizes": "72x72"
13     },
14     {
15       "src": "image\\watch2.png",
16       "type": "image/png",
17       "sizes": "96x96"
18     },
19     {
20       "src": "image\\watch3.png",
21       "type": "image/png",
22       "sizes": "128x128"
23     },
24     {
25       "src": "image\\watch4.png",
26       "type": "image/png",
27       "sizes": "144x144"
28     }
29   ],
30   "description": "Futuristic Watch Store for purchasing the latest and trendiest watches."
31 }
32
```

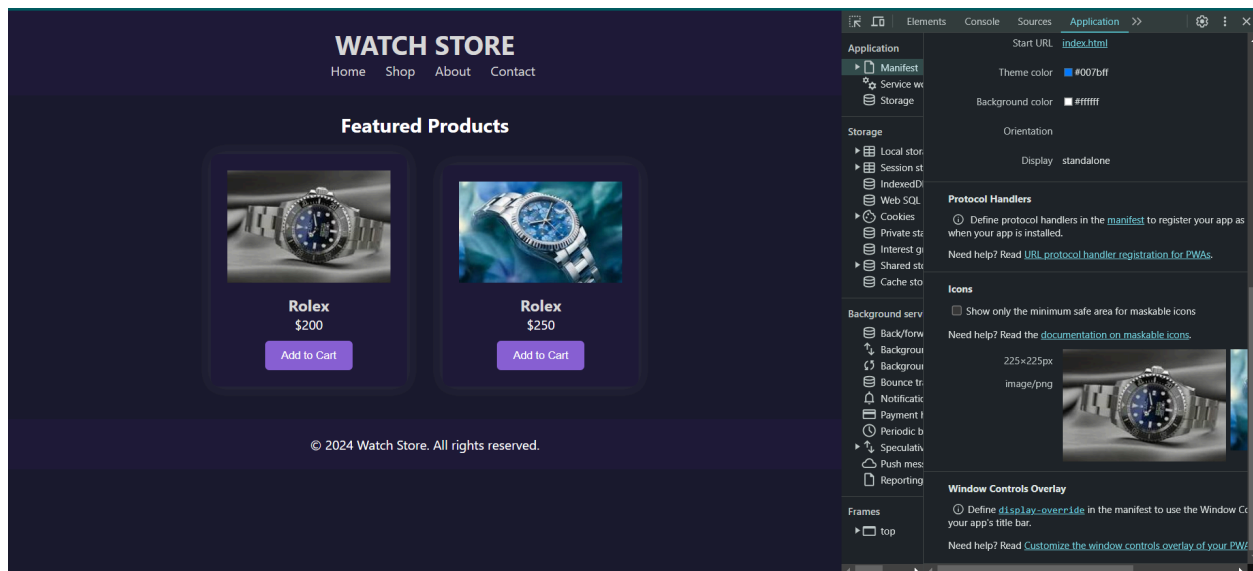

**Step 3:** Create a new folder named images and place all the icons related to the application in that folder. It is recommended to have the dimensions of the icons at least 192 by 192 pixels and 512 by 512 pixels. The image name and dimensions should match that of the manifest file.

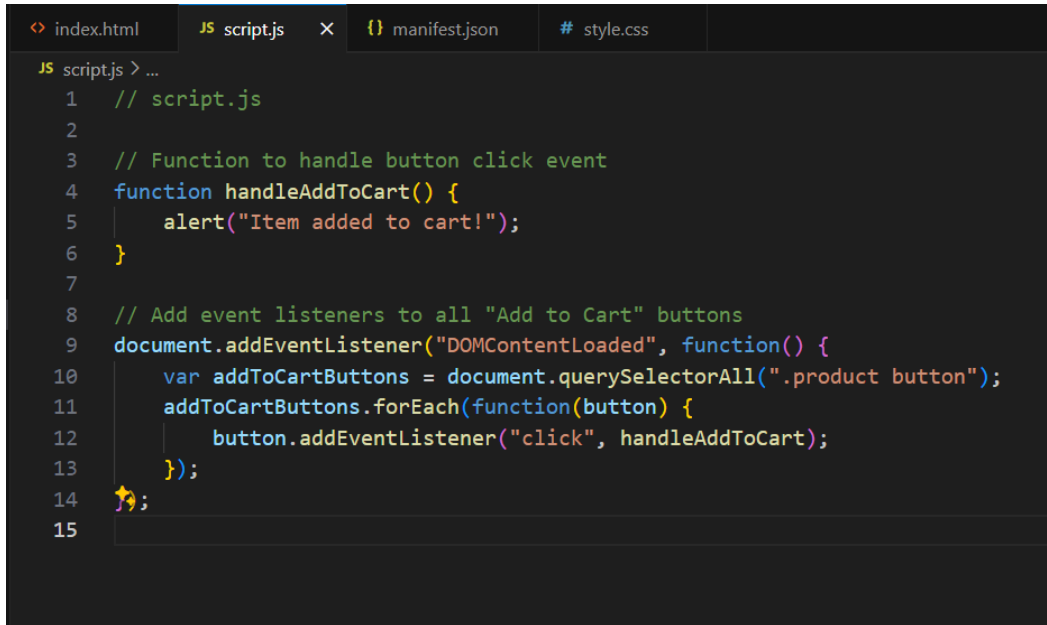

**Step 4:** Serve the directory using a live server so that all files are accessible

**Step 5:** Open the index.html file in Chrome navigate to the Application Section in the Chrome Developer Tools. Open the manifest column from the list.

**Step 6:** Under the installability tab, it would show that no service worker is detected. We will need to create another file for the PWA, that is, serviceworker.js in the same directory. This file handles the configuration of a service worker that will manage the working of the application.

```
index.html JS script.js X {} manifest.json # style.css
JS script.js > ...
1 // script.js
2
3 // Function to handle button click event
4 function handleAddToCart() {
5     alert("Item added to cart!");
6 }
7
8 // Add event listeners to all "Add to Cart" buttons
9 document.addEventListener("DOMContentLoaded", function() {
10     var addToCartButtons = document.querySelectorAll(".product button");
11     addToCartButtons.forEach(function(button) {
12         button.addEventListener("click", handleAddToCart);
13     });
14 });
15
```

**Step 7:** The last step is to link the service worker file to index.html. This is done by adding a short JavaScript script to the index.html created in the above steps. Add the below code inside the script tag in index.html.

```
<head>
  <meta charset="UTF-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <title>Futuristic Watch Store</title>
  <link rel="stylesheet" href="style.css">
  <link rel="manifest" href="manifest.json">
  <script src="script.js" defer></script>
</head>
```

**Installing the application:** Navigating to the Service Worker tab, we see that the service worker is registered successfully and now an install option will be displayed that will allow us to install our app. Click on the install button to install the application. The application would then be installed, and it would be visible on the desktop. For installing the application on a mobile device, the Add to Home screen option in the mobile browser can be used. This will install the application on the device.

**Conclusion:** Thus writing metadata for the PWA, especially for an eCommerce application, is crucial for enabling features like the "add to homescreen" functionality. By crafting a well-structured manifest.json file with accurate metadata properties such as name, description, icons, and colors, developers can enhance the accessibility and user experience of their PW
